

WHO CAN BENEFIT FROM DENTAL BOTOX?

EDENTULOUS PATIENTS

These patients have benefited from **Botox treatment** in cases where the **lip muscles** have become repositioned due to decreased **vertical dimension**.

Dentures won't always fit in these situations and Botox can **relax and retrain** the muscles around a new denture to make the transition much **more successful**.

HIGH LIP LINE OR "GUMMY" SMILE

Patients with a **high lip line** can use Botox to help **relax lip muscles** and achieve a lower, more **aesthetic smile line**. This is popular because the entire process isn't very invasive and can provide a **more immediate form of treatment**.

TMJ DISORDER

Temporomandibular Joint Disorder can cause severe pain from **hyperactivity of the muscles** and treatment options have been limited in the past. Now, Botox will relax these muscles and dental professionals can offer **quick + efficient pain relief**.

BRUXISM

Bruxism can also be **minimized with Botox** reducing the force of the muscular contractions involved. These injections can make a useful **adjunct therapy** to night guard appliances.
